Project title: Human vs. AI Comparison in Facial Emotion Recognition

Study Description

The purpose of the study is to investigate how human perception of facial emotions compares with the predictions generated by AI facial emotion recognition systems, across normal and degraded images.

During the study the participant will be shown a series of facial images and asked to evaluate the emotions you perceive (example: happiness, sadness, anger, surprise, fear, disgust, & neutral). The activity is expected to take approximately 10-15 minutes.

The collected responses are analyzed statistically and compared with the outputs of AI models such as DeepFace and FER. The results will be used solely for academic purposes within the course project, report, and presentation.

Participation is entirely voluntary, and the participant may withdraw at any time without providing a reason.

Participant Information and Consent

Surname: _____ Name: _____

Matricola: _____

Date: _____ Signature: _____

☐ I have read and understood the information provided about this study

☐ I voluntarily agree to participate in this study
